How Were Egyptian Pyramids Built?

The Egyptian pyramids are great structures that were used from 2700 B.C to 1700 B.C. The pyramids at Giza are the largest, most well-known pyramids around the world.

To get the stone bricks into place they had to use a ramp. The ramps were made out of mud bricks and coated with small bits of plaster to strengthen the surface. The pyramids were made out of lime stone blocks. The lime stone was mined from quarries.

To pull the bricks the Egyptians had to use a rope. To slide the bricks easily they had to lubricate the bricks with oil so they could slide off the ramps easily.

The Egyptians made the pyramids to put dead bodies in because they thought their soul would return to the body in the afterlife.

The Egyptians built the pyramids with a square base and triangular slides pointing to heaven.

The Egyptians pyramids were made by man without the help of huge machinery.
